Plass M., Hartmann E., Mueller O., Kuhlmann J.;

Alfaentification of a Sus scrofa gene encoding a protein with high
similarity to p53 from Homo sapiens, Bos taurus and Ovis aries.";
Submitted (JAN-1999) to the BMEL/GenBank/DDBJ databases.

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES
GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSTOLOGICAL
CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN
TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATE CELL DIVISION BY
CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE
ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.
ACTIVATED GENES IS AN INHIBITOR OF STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
EXPRESSION (BY SIMILARITY).
--- SUBGELLULAR LOCATION; NUCLEAR (BY SIMILARITY).
--- SUBGELLULAR LOCATION; NUCLEAR (BY SIMILARITY).
--- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF MANY TYPES OF CANCER.

MANY TYPES OF CANCER. (BY SIMILARITY).
--- STANT BYTHES OF CANCER (BY SIMILARITY).
--- STANT BYTHES OF CANCER (BY SIMILARITY).
--- DISEASE: P53 IS FOUND IN SUCHEAR (BY SIMILARITY).
--- STANT BYTHES OF CANCER (BY SIMILARITY).

Cintra A.C.O., Vieira C.A., Giglio J.R.;

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990).

-!- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANOIOTENSIN-CONVERTING BUXYME AND ENHANCES THE ACTION OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.

PIR; G37196; G37196.

"Purification and pore-forming activity of two hydrophobic polypeptides from the secretion of the Red sea moses sole (Pardachirus marmoratus)."

Biol. Chem. 261:16704-16713(1986).

--- FUNCTION: EXHIBITS UNUSUAL SHARK REPELLENT AND SURFACTANT PROPERTIES. FORMS VOLTAGE-DEPENDENT, ION-PERMEABLE CHANNELS IN MEMBRANES. AT HIGH CONCENTRATION CAUSES CELL MEMBRANE LYSIS.

--- SUBUNIT: MONOWER. IN AQUEDOUS SOLUTION EXISTS AS A TETRAMER.

--- SUBCELLULAR LOCATION: Secreted.

--- SUBLELLULAR LOCATION: Secreted.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A Geneseq 101002:*

This invention describes a novel method for preparing a peptide or recombinant antibody, which mimics an antigenic carbohydrate. The peptides and recombinant antibodies prepared to mimic antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrates antibodies to the antigenic carbohydrate, e.g. as vaccine carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine adjuvants. The peptides can be used to inhibit binding of a ligand to a receptor, which is an antigenic carbohydrate. The methods are used to prepare the peptides and antigenic carbohydrates. Carbohydrate-conjugate vaccines could be used in tumour immunity and cancer therapy. The peptides and antibodies can also be used as antibacterials. Peptides that mimic carbohydrate antigens can be carbohydrates and partigens can be used to develop a longer lasting immune response. Other advantages of the peptide mimics are; (1) the chemical composition and purity of synthesized peptides can be precisely defined; (2) the immunogenicity of the peptides can be significantly enhanced by polymerization or addition or relatively small carrier molecules that reduce the total
                                                                                                                                                                                        Mimotope, antigen, carbohydrate, antibody, mimic, vaccine, adjuvant, tumour immunity, cancer therapy, antibacterial, immune response, immunogenicity, anti-idiotype, T cell response manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides and recombinant antibody mimics of carbohydrate antigens,

Tumour metastasis requires detachment of malignant cells from the primary tumour, penetration of blood or lymph vessels and attachment to the endothelium of distant organs, ultimately resulting in the formation of new tumours. The selectin family of adhesion molecules is implicated in this process. E-selectin family of adhesion molecule six implicated in this process. E-selectin is a calcium-dependent molecule expressed by activated vascular endothelium. E-selectins bind to glyoconjugates carrying a terminal tetrasaccharide Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen is Lewis Y (LeY). The binding of selectin molecules to their ligands is thought to be an important step in metastasis. Therefore, inhibition of E-selectin-dependent carbohydrate—mediated interactions is thought to be a target for anti-cancer therapy. The present sequence is a non planar-X-planar type motif. This motif is thought to bind to anti-LeY antibody BRS5-2. BRS5-2 is a peptido-mimetics of E-selectins. Peptides that block E-selectin-LeY binding and therefore adhesion of tumour cells and leukocytes to endothelial cells inhibit metastasis.
                                                                                                                                                                                                                                       0
amount of antigen required for immunization; (3) peptide synthesis may be more practical than synthesis of carbohydrate-protein conjugates or the production of anti-idiotypes; (4) peptide mimicking sequences can be engineered into DNA plasmids for DNA vaccination to further manipulate T cell responses. ANY33028-Y333087 represent the carbohydrate antigen peptide mimotopes described in the invention.

Peptides such as this are used to prevent or treat sex-hormone dependent disorders in human or veterinary medicine, esp. cancers (of the prostate, uterus, breast or pituitary), also cancers (of the prostate or precocious puberty, but also amenorrhoea, premenstrual syndrome, multilocular ovarian syndrome, comedo, etc.; also to control pregnancy (contraception for men or women, also to induce ovulation) and the menstrual cycle. They are also used to control oestrus in animals, to improve meat quality and control control oestrus in animals, to improve meat quality and control growth, and to promote spawning in fish. They may also inhibit the transient increase in testosterone blood levels caused by admin. of superagonists such as leuprorelin acetate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptides of the invention which interfere with the binding of the p53 tumour suppressor protein and the MDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein binding motif between amino acids 16-33 (AAR89914). The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptides of the invention which interfere with the binding of the

receptor function, for example NRS can stimulate transcription in response to hormone binding by recruiting coactivator proteins to the propose to hormone binding by recruiting coactivator proteins to the cativity of a transcription domain. AF2, that is part of the cativity of a transcription domain. The method may be used to identify an agonist or antagonist of coactivator binding to a nuclear receptor. The methods can also be used to identify an agonist or antagonist of coactivator binding to a nuclear receptor of interest. The methods are applicable to generating new compounds that distinguish nuclear receptor isoforms. This can facilitate generation of either tissue specific or function-specific compounds. Nuclear receptors have been implicated in a variety of medical disorders, including breast cancer, prostate cancer, cardiac arrhythmia, infertility, osteoporosis, Ohyperthyroidism, hypercholesterolaemia and obbsity. Sequences AMYSB282. AMYSB302 represent the regions (NR-boxes 1-3) of pl60 coactivator binding proteins which interact with the nuclear receptor coactivator binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates a method of identification of a compound that modulates coactivator binding to a nuclear receptor. The method compounds that fit spatially into a nuclear receptor (NR) coactivator binding site of interest using an atomic structural model of a nuclear receptor coactivator binding site. The ceptor compounds are screened by their ability to bind to an NR coactivator binding site, leading to the identification of a compound which modulates coactivator binding. Nuclear receptors are a superfamily of hormone/ ligand activated transcription factors, and includes thyroid hormone receptors (TRS), retinoid receptors (RARs and RARS), peroxisome receptors (PRARs and XPARS), vientin D receptors (VDRS), oestrogen receptors (ERS), glucocorticoid receptors (GRS), progestin receptors (RRS), mineralocorticoid receptors (MRS), and and solved receptors (RRS) and solved r

ö
sites (AAYS8307-Y58328). The NR coactivator binding sites comprise two regions of the NR; helices 3-6 (H3-H6), and helix 12 (H12). The coactivator NR-boxes all share a consensus sequence LXXLL (AAYS8278), with the NR-box 2 motifs sharing the consensus motif ILXXLL (AAYS8279). Sequences AAYS8280-Y58281 represent the hydrophobic interaction motifs of p53 and VP16 used in an exemplification of the invention. Sequences AAYS8329-Y58240 represent mutant versions of the human Grip-1 NR-box 2 sequence (AAYS8283), and sequences AAYS8341-Y58353 represent mutant versions of the human Grip-1 NR-box 2 versions of NR coactivator binding sites, used in exemplifications of the

                                                                                                                                                                                                                                                                                             d
```

The invention relates to a method for identifying a compound that

```
modulates coactivator binding to a nuclear receptor (NR). The method comprises modelling test compounds that fit electrostatically into an NR caactivator binding site (BS) using an appropriate atomic structural model of (BS); screening the test compounds in an assay characterised by binding of a test compound to (BS); and identifying a library or test compound that modulates coactivator binding to the NR. The methods of the invention are useful for identifying peptides, peptidomimetics, or small netral or synthetic organic molecules that modulate nuclear receptor natural or synthetic organic molecules that modulate nuclear receptor activity, particularly new lead compounds, scaffolds and combinatorial libraries. The methods are used in selecting and characterising structure function relationships of natural or synthetic coactivator compounds, which are useful in treating nuclear receptor-based disorders e.g. breast cancer, prostate cancer, cardiac arrhythmia, infertility, osteoporosis, hyperchycidism, hypercholesterolaemia or obesity. This sequence compended (RR) nuclear receptor of the invention is able to interact with peptides containing this motif.
                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "(Ac- or 1-adamantyl acetic acid)- D-Phe"

generically. The present peptide is a specifically claimed example of the generic compounds.

The peptides are useful for treating hypertension, metabolic and endocrine disorders, congestive heart failure, mycoardial infarction, endotoxic shock, subarachnoid haemorrhage, arrhythmia, asthma, acute and chronic renal failure, preeclampsia, diabetes, neurological disorders, pulmonary hypertension, ischaemic disease, ischaemic bowel disease, gastric mucosal damage, Raynaud's disease, restenosis, percutaneous transluminal coronary angioplasty, angina and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antagonists of endothelin are claimed which are C-terminal hexapetides and analogs of ET-1. The first (N-terminal) amino acid of the new peptides has D-configuration. The peptides are claimed generically. The present peptide is a specifically claimed example
